What's New in the?

This is the portable version of AoA Audio Extractor, a tool that can convert video files of several formats (e.g. AVI, 3GP, MPEG, FLV, MOV) to the MP3, WAV or AC3 extension. Since this is a portable software, installation is not necessary. So, you can place AoA Audio Extractor on an external device and run the executable file on any computer. More importantly, there will be no changes made to your registry keys. The interface of the app is simple and intuitive. Portable AoA Audio Extractor can be easily used by individuals with any experience level. You can import videos by using the file browser or the "drag and drop" method (batch processing is supported). In the list you can check out the title, start and end time, as well as source and output format of each file. Furthermore, you can configure audio settings when it comes to the bit rate, sample frequency rate and channel, as well as specify the output directory, preview the videos and trim clips by setting the starting and ending

point. The application runs on low-to-moderate system resources and quickly finishes an extraction task. The sound quality is excellent. However, Portable AoA Audio Extractor crashed once during our tests, when trying to extract the MP3 file from an MPEG video (which had been previously converted). Even so, we strongly recommend this straightforward tool to all users. Serialize and de-serialize E-learning course content without changing its structures. Some companies that sell E-learning courses usually have a need to move them to different target platforms (e.g. mobile phones, tablets, TV, etc.) at some point in time. In order to do that, those companies need to re-create the contents, which can be time consuming and could not be justified for companies that sell many courses. The main target of the serializer module is to write serialized version of objects. It takes the serialized version of an object and produces a file that can be used to restore the original object. The serialized version can be exported as text or binary files, which means that it can be changed if needed. It is also possible to add validation checks that will only accept valid values. This module is designed as a general purpose solution, so it can be used for different types of objects. It was written using a component-oriented approach and is based on the Apache Commons Bean Validation library. It has been tested with Java 1.7 and later, but it is also capable of serializing Java objects in Java 6. This is a serialize and de-serialize object converter. It reads the object contents and transforms the contents to another format, and it does the same thing vice versa. The conversion process is based on the command line arguments provided during the execution.
